IDENTIFIERS Arrests; Child Mortality; *Indicators; *Minnesota; Out of Home Care; School Lunch Program

ABSTRACT

This KIDS COUNT data book examines trends in the well-being of Minnesota's children. The statistical portrait is based on 11 indicators of child well-being: (1) children living in poverty; (2) children in families receiving food stamps; (3) children receiving free or reduced-price school lunch; (4) children born to teenage mothers; (5) children born at low birthweight; (6) children transferring schools; (7) children not graduating on time; (8) children arrested for serious crime; (9) children abused and neglected; (10) children in out-of-home placements; and (11) children dying from homicide, suicide and injuries. Following an introduction, the data book provides regional and statewide statistical summaries for each indicator, discusses the importance of the indicator, describes potential improvement strategies, and notes Minnesota trends. The second section and bulk of the report provides data by county, including demographics, areas of positive improvement and concern, and trends to watch. Data are compared for 1991, 1996, and 2000, and data for individual counties are compared to the overall statewide data. Among the long-term trends noted are a 10 percent decrease in poverty among children, a 23 percent increase in children born at low birthweight, and a 14 percent decrease in children born to teen mothers. Shorter term trends include fewer children in families receiving food stamps. (SD)

INTRODUCTION

This edition of Minnesota Kids: A Closer Look, 2002 Data Book, looks at an entire decade of data. By stepping back and looking at this set of eleven indicators, we can make better decisions to improve our children's futures. We can decide how to prioritize our resources and where to focus our energy and initiative. We can see where we are succeeding and where we need to do more. We can recommit ourselves to ensuring that no child is left behind.

In summary, some things have improved for children. We have fewer children living below the poverty line, fewer births to teens, fewer arrests for serious crime. However, we have more low birth-weight babies, more children living in near-poverty, and no improvement in reports of abuse and neglect or in the number of children in foster care and other out-of-home placements.

Trends for the Decade

- o A 10% decrease in poverty among children. Still, an estimated 13%, or almost one in eight, live below the poverty line.
- o An 11% increase in children received free/reduced price school lunch, meaning

their families made less than 185% of the poverty line. One in four children live in these families.

- o A 23% increase in children born at low birth weight. One out of every sixteen babies was born at low birth weight in 2000.
- o A 14% decrease in children born to teen mothers. There were 1,790 births to teens in 2000.
- o A 31% decrease in arrests of children for serious crimes. In 2000, there were 1,398 arrests.
- o One out of every 116 children had a substantiated report of child abuse and neglect in 2000, a rate that has remained steady since 1991.
- o The rate of children in foster care and other out of home placements has remained steady through the decade. In 2000, 18,451 children were placed.
- o A six percent decrease in children dying from homicide, suicide or injuries.

Introduction, continued on p. 3

INTRODUCTION, continued

Shorter-Term Trends

- o Since 1993, 39% fewer children received food stamps. In 2000, an estimated 104,262 children received food stamps.
- o There was one school transfer for every seven students in 1999-2000. This is a 14% increase from 1992-93.
- o About one in five students did not graduate on time in 2000. This rate is unchanged from 1997.

On page 20 of this year's data book, we introduce the legislative portion of the Minnesota campaign to Leave No Child Behind. Along with this legislative effort, we will be engaging in the coming months in a strategy to actively engage the public in these issues. One key strategy is a set of KIDS

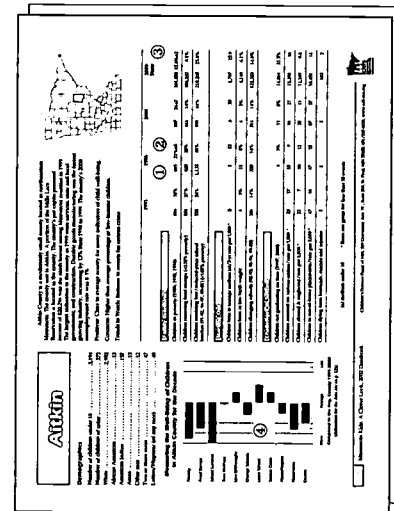

COUNT Coffees, held in April of 2002. These informal community meetings, held in 20 locations throughout Minnesota, offer the opportunity for people to learn about the well-being of children in their local area and to identify ways to become more involved in advocating on their behalf. Other components of Children's Defense Fund-Minnesota's outreach strategy include: getting more families enrolled in the public programs for which they are eligible, including MinnesotaCare and Medical Assistance, the child-care Sliding Fee Program, and tax credits; training community coordinators and volunteers to help families enroll in these public programs and to support legislative initiatives; registering voters; and using the media and other communication vehicles.

If you would like to join us in these efforts, please call (651) 227-6121 or visit our web site at <http://www.cdf-mn.org>.

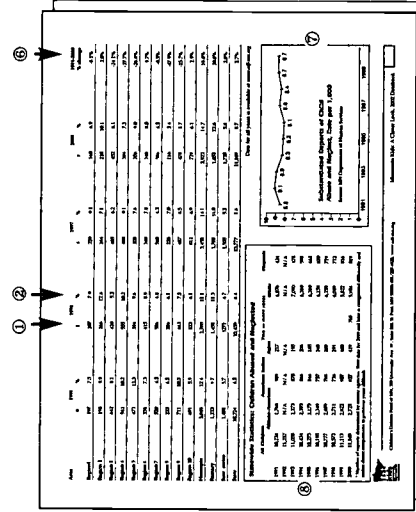

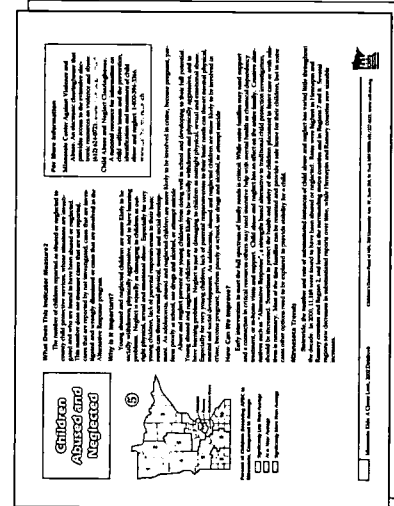

How to Read the Tables

- ① **Number of Children.** It helps to know the actual number of children affected by a problem, as well as the percentage. Small numbers in a category may fluctuate significantly from year to year, making interpretation more difficult.
- ② **Percent or Rate of Children** (compared to total population, total births, total school enrollment, etc.). Unless the number of children is very small, percentages and rates provide useful comparisons across time, even if the comparison group increases or decreases in size.
- ③ **State Average.** This number compares a county to the state as a whole.
- ④ **Bar Charts.** These charts allow comparisons of different indicators within a county. At a glance, a county can be compared to the "average county." (For more detail about the bar charts, please see the data notes at the end of the book.)
- ⑤ **Map.** The map ranks regions in thirds, allowing for regional comparisons. It can also help determine if a problem is concentrated in certain areas of the state.
- ⑥ **Percent Change.** This figure reveals trends over time (1991-1998). Small numbers in some regions can create relatively large percentage changes, however.
- ⑦ **Line Graph.** This shows the statewide trend for an indicator for each year of available data.
- ⑧ **Statewide Statistics by Race.** This provides a breakdown of the data by race and ethnicity when available.

Sample Indicator Pages

Family Economics

Children Living in Poverty

What Does This Indicator Measure?

The number of children in Minnesota who live in families with incomes below the federally-defined definition of poverty, as compared to all children. These numbers are estimates by the U.S. Census Bureau, and changes in the economy since 1997 are not reflected in these figures.

Why Is It Important?

Poverty matters to poor children and their parents, and it matters to society. Poor children are at increased risk of health problems including low birth weight, stunted growth, and anemia; educational problems including lower test scores and learning disabilities; and increased likelihood of dropping out of school, becoming single parents, and being poor themselves as adults.

Growing up poor matters due to a combination of factors that affect every area of a child's life. For example, low-income families may have more stress and conflict due to feeling more economic pressure. There may be more limited learning opportunities at home because of lack of books or computers, or less likelihood of attending camp, participating in music lessons or athletics. Children in poor families are more likely to experience lower quality childcare, poor nutrition, and bad housing (which can cause serious health problems such as asthma, which in turn can result in a child missing school.) Finally, low-income families may be more isolated, lacking regular phone service and reliable transportation.

How Can We Improve?

According to the Center for Budget and Policy Priorities, the two factors that have contributed the most to the decrease in child poverty since 1993 are increases in employment and wages and an expansion of the federal Earned Income Tax Credit (a tax credit for low-income working families.) In order to improve employment and increase wages, however, low-income parents need education and training for well-paying jobs, adequate, affordable childcare and health care, and stable housing. Otherwise, working intermittently at low-wage jobs without benefits will not pull families out of poverty.

Minnesota Trends

The percentage of children in poverty has declined since 1989 for most regions and the state as a whole, although Ramsey County and the surrounding metro counties had modest increases. In 1998, it was estimated that 161,858 children — almost one in eight Minnesota children — lived below the poverty line. The percent of children in poverty varied greatly between regions, from 7% in the surrounding suburban counties, to 23% in Region 2 in north central Minnesota.

Children Receiving Food Stamps

What Does This Indicator Measure?

The estimated number of children receiving food stamps in July of each year (51% of the total caseload) as a percentage of the total number of children. Family income must be less than 135% of the poverty line, along with certain other asset limitations.

Why Is It Important?

Food stamps prevent hunger and malnutrition by providing assistance with food expenses to low-income families. Food stamps are often used by working families to supplement their low wages. In spite of the food stamp program, hunger and food insecurity persist. Minnesota statistics from the US Department of Agriculture show that from 1996-98, 3% of children lived in households experiencing food insecurity with hunger, and 7% of children lived in households that were food insecure but did not report actual hunger. "Food insecure" households without hunger reported difficulty obtaining enough food, reduced quality of diets, anxiety about their food supply, and increased use of emergency food sources. According to Minnesota Food Share, almost 5% of Minnesotans use food shelves, and half of these users are children.

How Can We Improve?

Food Stamps is a federal program whose participation is limited only by income eligibility. However, many families who are eligible for food stamps do not receive them. A recent study of food stamp participation rates conducted by the Mathematica Policy Research group for the USDA suggests that approximately 56% of eligible Minnesotans actually receive food stamps, and that this rate has fallen since 1995. This suggests that at least some of the drop in the number of Minnesota children receiving food stamps is due to eligible families no longer receiving the program, rather than families increasing their income.

Outreach programs to low income families through schools and work sites as well as outreach to eligible legal immigrants could improve access to the food stamp program and help ensure that all children receive adequate nutrition.

Minnesota Trends

About one in twelve, or 8.1% of Minnesota children received food stamps in 2000. Minnesota has seen a steady decrease in the number of children receiving food stamps since 1995. All regions have experienced large decreases, ranging from 22 to 51%. The percentage of children receiving food stamps is highest in Regions 2 and 3 as well as Hennepin and Ramsey counties. The surrounding metro counties had the lowest rate of food stamp use, and also saw a 42% decline between 1994 and 2000.

Children Receiving Free or Reduced-Price School Lunch

What Does This Indicator Measure?

The number of school-age children who live in low-income families (below 185% of the poverty line), as measured by their receipt of free or reduced-price school lunches, compared to the total number of students.

Why Is It Important?

Many children receiving free or reduced-price school lunches live in working-poor families, where at least one parent is working full-time, year round, yet these families still find themselves unable to provide for the basic needs of their children.

Working-poor families have many obstacles that other families may not encounter. They are less likely than wealthier families to be covered by health insurance. Also, in those families that required childcare, and one in five paid more than two fifths of their income.

In addition, the gap between those families with incomes in the top 20% and the bottom 20% has been growing over the past few decades. Since the 1970s, the inflation-adjusted incomes for the bottom fifth have actually gone down 2%, while those for the top fifth have gone up 43%.

School meals themselves are also important by providing educational and nutritional benefits to students. School lunches provide 1/3 to 1/2 of the recommended daily allowances for key nutrients. Children who eat school meals perform better on standardized achievement tests and are late and absent from school less often than children who do not participate in the programs.

How Can We Improve?

Programs to support the self-sufficiency of low-income, working families are critical, including the Earned Income Tax Credit and Minnesota Family Credits, which increase the annual income for low-wage workers; the Basic Sliding Fee child care program, which allows parents to work by assisting with child care expenses; and Minnesota Care, which helps families obtain health care for their children. In addition, the school breakfast program should continue to be expanded to cover all eligible children.

Minnesota Trends

Statewide, free or reduced-price school lunch participation has slowly increased by almost 11% over the decade, although it has been steady and slightly dropping in the last three years. In the 2000-2001 school year, 26% of students participated in the program, meaning that at least one in four Minnesota students comes from a low-income family. Over 18% received free lunch, meaning that their families were below 135% of the poverty level. The percentage of students in the program reflects differing poverty rates between regions of the state. The highest rates were 50% in Region 2, and around 40% in Region 5 and Ramsey County. The lowest rates were 12% in the surrounding metro area counties. Trends in participation varied between regions.

Low Wage Workers and the Minnesota Economy

In order to support families, Minnesota workers need living wage jobs. A recent report by the Department of Economic Security found that in 2000:

- 31% of workers in Minnesota earned less than \$10 per hour (full-time, year-round equivalent of less than \$20,800.)
- 25% of workers earned between \$10 and \$15 per hour (full-time, year-round equivalent of \$20,800 to \$31,200.)
- The median hourly wage increased slightly from 1998 to \$13.68. (This means that half of workers earned more than this amount and half earned less.)
- The longer workers stay in one job, the higher their wages are likely to be. Only 18% of workers who had one job for all of 2000 earned less than \$10 per hour, compared to over 60% of workers who were in a job for three months or less.
- The percentage of low-wage workers varies greatly by industry. For example:

Industry	Percent of Low-Wage Workers (below \$10/hour)
Retail Trade	63%
Agriculture	52%
Services	31%
Manufacturing	17%
State Government	7%

- The most recent job outlook forecasts through 2008 show that the fastest growing sectors will be two of the sectors with the lowest wages, services and trade.
- One third of job growth will be professional, paraprofessional and technical jobs, (such as computer system analysts, computer engineers) followed by service occupations, (home health aides, waiters, nursing aides) sales, (retail salespersons, cashiers) and operator, fabricator and laborer jobs (truck drivers, packagers.)

Starting Out

Children Born to Teenage Mothers

Percent of Children Born to Teenage Mothers in Minnesota, Compared to Average

- ☐ Significantly Less Than Average
- ☐ At or Near Average
- ☐ Significantly More Than Average

What Does This Indicator Measure?

The number of children born to mothers under eighteen years of age, and the three-year birth rate for young women ages 15-17. The rate of these births is given as a three-year average for ages 15-17 in order to increase accuracy for smaller regions and counties.

Why Is It Important?

Teen births present difficulties both for the young mothers and for their children. Young mothers are more likely to not complete high school and are less able to support their families than older mothers. Most young fathers are also ill-equipped to take on the responsibilities of fathering due to lack of education and job skills, leading to low wages. Children born to teen mothers are more likely to have increased health, academic, and social problems as they grow up, including poorer school performance and an increased risk of child abuse and neglect.

Many Minnesota teenagers are sexually active, according to the 1998 Minnesota Student Survey conducted by the Minnesota Department of Children Families and Learning. By ninth grade, 20% of females and 28% of males are sexually active. By twelfth grade, the percentages are 51% of females and 49% of males. However, these rates have declined by 25% for males and 16% for females since 1989. Only half of sexually active twelfth graders reported using a condom the last time they had sex.

How Can We Improve?

Successful education programs focus on reducing sexual behaviors that lead to unintended pregnancy; use behavioral goals, teaching methods, and materials that are appropriate to the age, sexual experience, and culture of the students; use proven effective approaches and teaching methods; include activities that address social and peer pressures about sexual activity; and utilize trained teachers and/or peers.

Recent surveys of teens by the National Campaign to Prevent Teen Pregnancy also show that they pay close attention to the values and beliefs of their parents, and that this strongly influences their sexual behavior. Finally, helping teenagers develop positive beliefs about their future possibilities may reduce the likelihood of early childbearing.

Minnesota Trends

In 1999, 1,887 children were born to teenage mothers. The rate of teen births has declined since 1993 for almost every region as well as the state as a whole. Region 2 and Hennepin and Ramsey counties had the highest teen birth rates in the state. Both Hennepin County and Region 5 had relatively high rates in 1993-95 but also had steep declines over the decade.

Children Born at Low Birth Weight

What Does This Indicator Measure?

The number of infants born weighing less than 2500 grams (5.5 pounds), including those born prematurely (before 37 weeks) and those born at full term but underweight, as a percentage of all births.

Why Is It Important?

As a group, infants born at low birth weight have higher rates of health problems than other children. By school age, children born at low birth weight are more likely to have mild learning disabilities, attention disorders, developmental impairments, and breathing problems.

Measuring the number of children born at low birth weight is also a good indicator of the overall level of prenatal care and maternal health. The three major risk factors for low birth weight are cigarette smoking during pregnancy, low maternal weight gain, and low pre-pregnancy weight. Other risks include overall maternal health, fetal infection, genetic make-up, and other health problems. Also, multiple births (twins, triplets, etc.) are more likely to be born at low birth weight. Low birth weight is more prevalent in births to African American and Hispanic/Latino women, and to women who give birth at younger ages.

How Can We Improve?

The three most effective prenatal intervention efforts identified by researchers are reducing smoking by pregnant women, improving nutrition for pregnant women, and providing better prenatal care. Consuming adequate amounts of folic acid throughout pregnancy may also reduce the risk of having a pre-term and low birth weight baby. Additional research into the causes of disparities among racial and ethnic groups is also needed, because these disparities exist even when studies have taken into account higher rates of other risk factors such as lack of prenatal care.

US Department of Agriculture, WIC Program Study. www.fns.usda.gov/wic/CONTENT/howwichelps.htm

A recent study of the WIC program (Women, Infants and Children) conducted by the US Department of Agriculture, found that mothers receiving WIC had:

- Longer pregnancies
- Fewer low birth-weight babies
- Fewer premature births
- Greater likelihood of prenatal care

The program saved approximately two to three dollars in health care costs for every one dollar spent on WIC.

Minnesota Trends

Just over one out of every seventeen children born in Minnesota in 1999 was born at low birth weight. This rate has increased slightly since the first part of the decade. Low birth weight babies were the most frequent in Ramsey County and in Regions 2,3, and 10. While all areas of the state saw an increase through the decade, in some regions, the increase was much larger than the state increase. African-American children are more likely to be born at low birth weight than are children of other races.

Children Transferring Schools

What Does This Indicator Measure?

The number of transfers occurring between public schools within a district or between schools in different districts during the school year, compared to the total school enrollment. Students who transferred more than once are counted each time they transfer schools.

Why is it Important?

According to a study on school mobility from the Kids Mobility Project, students who move often have lower attendance rates, which impacts their school achievement. Studies have found that average reading scores for students who moved three or more times were half those of students who did not move. Students who, on average, were absent 20% of the time scored 20 points lower than students who attended school nearly every day. Also, students who moved often had more problems with behavior and making friends and were more likely to be suspended.

Although moves are sometimes positive for families, 59% of families who moved in the study did so to cope with housing or personal problems, and 21% were forced to move because of eviction, property condemnation, etc. Although available state data is not kept by race or economic status, in this study, students of color and low-income students were most likely to be mobile.

How Can We Improve?

Safe, affordable, stable housing is key to reducing frequent family moves. This involves public and private initiatives at state and local levels to create, rehabilitate, and maintain existing affordable housing. Additional efforts should be made to keep children in the same school when possible, even if families move within a district or experience a period of homelessness. Efforts to standardize curriculum across schools can also help ease transitions for students.

Minnesota Trends

There was about one transfer for every seven children during the 1999-00 school year. The percentage of transfers in all Minnesota schools increased by almost 14% from 1992-93 to 1999-2000. Over the past eight years, transfers increased in almost every region, with the exception of the surrounding suburban counties. Regions 2, 3, and 6 saw the largest increases in greater Minnesota; Hennepin and Ramsey Counties had the highest percentages of transfers, with increases in the last year of data. Schools in the western Minnesota regions had the most stable enrollment.

Minnesota Act to Leave No Child Behind

In 2002, the Minnesota Office of the Children's Defense Fund has launched a state version of the Act to Leave No Child Behind. For more information about the National Act, visit www.childrensdefense.org.

Ensuring that Every Child in Minnesota Has:

A Healthy Start

- Develop an asthma surveillance system
- Provide a child in Medical Assistance (MA) with 12 months of continuous coverage.
- Hold health plans accountable for providing health services for children through the Child and Teen Check-Up.
- Develop a sliding fee schedule to lower premium costs for children in Minnesota Care program and providing continuous health care coverage for adults on public assistance.

A Head Start

- Make policy changes to At-Home-Infant Care program to help more working families.
- Fund and create TEACH program to provide wage subsidies and scholarships for child care workers help resolve the staffing crisis.
- Provide more families with child care assistance through the Basic Sliding Fee program.

A Safe Start

- Increase permanence for abused and neglected children by equalizing assistance payments for adoptive, relative care and foster parents.
- Reduce the number of homeless children and families by increasing funds to the state's homeless prevention grant program.
- Continue assistance to children in families on public assistance reaching welfare time limits.

A Fair Start

- Increase the Minimum Wage to \$7.00.
- Target tax relief to families with children by adopting a \$60 child tax credit.

Challenges to Success

Children Not Graduating on Time

What Does This Indicator Measure?

The number of students from a particular class (i.e. the Class of 1998) who do not graduate on time compared to the total number of students. Students who do not graduate on time either dropped out sometime between ninth and twelfth grades, or continued on in high school. This differs from the single year dropout rate used in previous data books, which measure the number of students of all grades who drop out in a particular year.

Why Is It Important?

Not graduating from high school is associated with many future problems for young adults. Students who drop out of school are three times as likely to slip into poverty in adulthood than those who finish high school. Job prospects are minimal for young and unskilled workers, and the earnings of high school dropouts are significantly lower than for those who complete more education. Measuring the on-time graduation rate also helps measure the effectiveness of schools in educating students.

How Can We Improve?

There is a high correlation between truancy and dropping out of school. Studies on truancy show that children at risk of dropping out can be detected as early as third grade. Early intervention with students and families can help break the pattern of truancy and ensure that children will complete high school.

Mentoring, which provides guidance and support for the child, can have a powerful effect on dropout rates. Students who drop out may feel that nobody in their life cares what they do, but mentors can reverse these negative thoughts and beliefs. In a recent study of the Big Brother/Big Sister program, it was shown that students participating in the mentoring program decreased their number of skipped classes by 37%.

Another preventive technique is alternative schooling, which can meet the variety of student needs not addressed by mainstream schools. By keeping a low teacher/student ratio, placing high expectations on students, and maintaining a flexible school schedule, they provide equal access to education for all students.

Minnesota Trends

Out of the entire class of 1999, about 21% of students did not graduate on time. Half of these students dropped out, and half continued on in Minnesota schools. Between 1997 and 1999, the number of seniors not graduating on time decreased by 13.5%. The most students graduated on time in Regions 1 and 8 and the fewest in Hennepin and Ramsey Counties and in Region 2. Students of color were much less likely than white students to graduate on time (see graph and chart on next page.) African American students were almost four times more likely than white students to not graduate on time; American Indian and Hispanic students were about three and a half times more likely, and Asian students were almost twice as likely as white students to not graduate on time.

Children Arrested for Serious Crime

What Does This Indicator Measure?

The number of children arrested for either crimes against people (murder, rape, robbery, aggravated assault) or crimes against property (burglary, auto theft, larceny.) The rate given is the number of arrests for these crimes divided by the estimated number of children ages 10-17. Variations in these numbers reflect the fact that arrest practices vary between jurisdictions.

Why Is It Important?

Crime has a negative effect on victims, perpetrators, and the community as a whole. Most children who commit crimes have other problems in their lives, including earlier victimization as young children, learning disabilities, substance abuse, family dysfunction, poor neighborhoods, and poverty. These "at-risk" children are also more likely to drop out of school and be unemployed, and face an increased likelihood of developing mental health problems.

How Can We Improve?

There are two ways to approach this situation: work to prevent youth from committing crimes in the first place and work with youth who have already committed one or more crimes. Some studies have shown that early in life, targeted home visits and enriched pre-school programs for high-risk children have lowered later delinquency by 80%. Providing training for parents and social competency for children with conduct disorders reduces problem behaviors in 70-90% of the cases. Violence prevention curricula in both middle and high school have been shown to decrease fighting and violent behavior among students. Also, statistics show that 50% of crimes committed by youth occur in the hours immediately following school. Targeted after-school activities and mentoring programs would reduce the amount of "down-time" children have to get into trouble.

Changes also need to be made with the way in which juvenile offenders are handled. The threat of being tried as an adult does not deter youth from crime, and transferring youth to adult courts increases future criminal behavior: they become repeat offenders more often, more quickly, and with more serious crimes than youth tried in juvenile courts. In addition, more non-residential services need to be created to help rehabilitate offenders. Developing alternative programs to hold offenders accountable while connecting them to positive resources in the community and providing quality aftercare to help offenders make successful transitions back into the community would be beneficial for all involved.

Minnesota Trends

There were 15,398 arrests of children for serious crimes in 2000, a rate of 26 arrests per 1,000 children. This rate has decreased by 31% since 1991. Of all arrests of children for serious crimes, 68% were for larceny (theft, including shoplifting); only 11% were for violent crimes, primarily assault. Rates decreased substantially for all regions, with the exception of Region 8. The highest rates were in Hennepin and Ramsey counties, and the lowest rates were in Regions 1 and 5.

Children Abused and Neglected

What Does This Indicator Measure?

The number of children reported to county child protective services as abused or neglected, whose situations are investigated and who are found to have been abused or neglected. This number does not measure cases that are not reported, cases that are reported but not investigated, cases that are investigated and wrongly dismissed, or cases that are involved in the Alternative Response program.

Why Is It Important?

Abuse and neglect prevent our young children from doing well in school and developing to their full potential. Young abused and neglected children are more likely to be socially withdrawn and physically aggressive, and to have learning problems. Neglect is just as damaging to children as outright physical, sexual, and emotional abuse. Especially for very young children, lack of parental responsiveness to their basic needs can thwart normal physical, mental, and social development. As adolescents, abused and neglected children are more likely to be involved in crime, become pregnant, perform poorly at school, use drugs and alcohol, or attempt suicide.

How Can We Improve?

Early intervention to meet the full spectrum of family needs is critical. While some families may need support and a connection to critical resources, others may need intensive help with mental health or chemical dependency treatment, or in-home visits and support. Child abuse and neglect has an effect on the entire family. Creative alternatives such as "Alternative Response," a strengths-based alternative to traditional child protection investigation, should be increased. Sometimes to protect the health and safety of the children placement in foster care or with relatives is necessary. Most of the time families can be reunited and provide a safe home for their children, but in some cases other options need to be explored to provide stability for a child.

Minnesota Trends

Statewide, the number and rate of substantiated instances of child abuse and neglect has varied little throughout the decade. In 2000, 11,169 were found to have been abused or neglected. Rates were highest in Hennepin and Ramsey counties and Region 2, and lowest in the surrounding metro counties and in Regions 7 and 8. Several regions saw decreases in substantiated reports over time, while Hennepin and Ramsey counties saw sizeable increases.

Children in Out-of-Home Placements

What Does This Indicator Measure?

The number of children placed in foster care, emergency foster care, group homes or residential treatment facilities by county social service agencies, compared to the total number of children. Placements through the criminal justice system are not included in these numbers.

Why Is It Important?

Children in out-of-home placement are usually there because of serious problems in their families. The placement could be because of abuse or neglect by parents or other caregivers. For older children, it could be because of conflict between them and their families. The average cost for a day in out-of-home placement is approximately \$54.00. This intervention, while sometimes necessary, has not only a large financial cost but a high emotional cost as well. Placement can be a stressful intervention for both the child and their family.

How Can We Improve?

In many cases, families need support, education, mental health services or other community-based resources to help alleviate family difficulties. Improved services could serve as a substitute for out-of-home placements for less serious cases. Investigation and intervention by county child protection agencies could be reserved for more serious cases where children's safety and well-being are threatened. In this way, services would better meet the diverse needs of families. More information is needed on placement outcomes to ensure that the services provided meet the needs of the children and their families.

Minnesota Trends

After an increase in the first part of the decade, the rate of out-of-home placements has remained decreased slightly at the end of the 1990's. In 2000, 18,451 children (14 out of every 1,000) were in out-of-home placements for some or all of the year. Regions 2, 3, and 5, and Hennepin and Ramsey counties had the highest rates of placement, while the surrounding metro counties and Region 6 had the lowest rates. The largest increases in out-of-home placements were in Ramsey County, Region 10, and Region 9; decreases were reported in Hennepin County, Region 3, and the surrounding metro counties.

Children Dying from Homicide, Suicide and Injuries

What Does This Indicator Measure?

The number of children who died each year from murder, suicide, car crashes, or other unintentional injuries compared to the total number of children. This information is collected from death certificates. Some murders and suicides within this category may be counted as unintentional injuries. Because of small numbers, rates are given as three-year averages.

Why is it Important?

Although the overall number of child deaths each year is relatively small, each child is a unique and precious person who cannot be replaced. Also, for every death due to injury, there are many more serious disabilities, hospitalizations and medical problems. For every completed suicide, there are numerous suicide attempts. For every murder, there are many other cases of assault and abuse. These deaths represent the tip of an iceberg of harm to children.

How Can We Improve?

Almost every one of these deaths is preventable. Proper safety seats for children and reducing drunk driving by teenagers would greatly reduce the number of auto-related fatalities. Injuries from falls, drowning, and poisoning could often have been prevented by improvements to children's environments and better supervision by adults. The depression, alcohol abuse, and other emotional distress that leads to suicide can be alleviated through early intervention and help for troubled children. And child deaths through murder, usually by a child's caregiver, require help and assistance to families dealing with mental health issues, chemical dependency, domestic violence, and abuse and neglect.

Minnesota Trends

The child death rate in Minnesota has decreased throughout the decade, to a rate of 1.3 out of every 10,000 children in 1999. Regions 2, 4, and 5 had the highest death rate for 1997 through 1999. The largest percentage of child deaths continues to be motor vehicle crashes, which comprise the majority of deaths in this category from 1991 through 1999. Suicides are 13%, and homicides are 12%.

Minnesota is the twentieth largest state in the United States. The per capita income in 1999 was \$30,742, eleventh highest in the country. The largest industries in 1999 were services, durable goods manufacturing, and state and local government. Construction was the fastest growing industry, increasing 13% between 1998 and 1999. The 2000 unemployment rate was 3.3%.

In the most recent national KIDS COUNT data book, which used 1998 data, Minnesota ranked second best in the nation on a set of indicators of child well-being. The state ranked best on indicators of the percentage of teens not attending school and not working (ranked 1st), percent of children in poverty (2nd), percent of families with children headed by a single parent (4th), and percent low birth weight babies (5th). Minnesota did less well on indicators of the percent of children living with parents who do not have full-time, year-round employment (8th), the infant mortality rate (8th), and the rate of teen deaths by accident, homicide and suicide (11th).

Measuring the Well-Being of Children in Aitkin County for the Decade

Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Aitkin County is a moderately small county located in northeastern Minnesota. The county seat is Aitkin. A portion of the Mille Lacs Reservation is located in the county. The county's per capita personal income of \$20,296 was the ninth lowest among Minnesota counties in 1999. The largest industries in the county in 1999 were services, state and local government, and construction. Durable goods manufacturing was the fastest growing industry, increasing by 13% from 1998 to 1999. The county's 2000 unemployment rate was 8.1%.

Positives: Close to average county for many indicators of child well-being.

Concerns: Higher than average percentage of low-income children and children in out-of-home placement.

Trends to Watch: Increase in arrests for serious crime.

Measuring the Well-Being of Children in Carlton County for the Decade

More Average Less
Compared to the Avg. County 1991-2000
 (definitions for the data are on p. 121)

Carlton County is a moderately large county located in northwestern Minnesota on the shore of Lake Superior. The county seat is Carlton. It includes part of the Fond du Lac Indian Reservation. In 1999, Carlton had a per capita personal income of \$21,990, which ranked sixty-second among Minnesota counties. State and local government, construction, and services were the largest industries. The fastest growing industry was construction, which increased over 65% between 1998 and 1999. The county's 2000 unemployment rate was 5.4%.

Positives: Close to average county for most indicators of child well-being.

Concerns: None based on these indicators.

Trends to Watch: Increase in percentage of children born at low birth weight and children changing schools. Decrease in arrests for serious crime.

Measuring the Well-Being of Children in Cass County for the Decade

Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Cass County is a mid-size county located in north central Minnesota. The county seat is Walker. Part of the Leech Lake Indian Reservation is within the county's borders. Cass County's 1999 per capita personal income of \$20,170 was the seventh lowest in the state. The largest industries in the county in 1999 were services, state and local government, and retail trade. The fastest growing industry was services, which increased by 11% between 1998 and 1999. The county's 2000 unemployment rate was 6.5%.

Positives: Average percentage of children born at low birth weight.

Concerns: Higher than average percentage of low-income children, births to teens, school transfers, children not graduating on time, reports of child abuse, out-of-home placements, and violent deaths.

Trends to Watch: Decrease in percentage of children in poverty and receiving food stamps, and decrease in teen birth rate.

Crow Wing County is located in the north central portion of

Minnesota and is the sixteenth largest county in Minnesota. The county seat is Brainerd. In 1999, Crow Wing County had a per capita personal income of \$23,606, ranking thirty-sixth among Minnesota counties. The largest industries in the county in 1999 were services, state and local government, and retail trade. Finances, insurance and real estate increased by 18% from 1998 to 1999, making it the fastest growing industry. The county's 2000 unemployment rate was 4.6%.

Positives: Close to average county for several indicators of child well-being.

Concerns: Higher than average percentage of students changing schools and not graduating on time and reports of child abuse and neglect.

Trends to Watch: Decrease in percentage of children receiving food stamps and reports of child abuse and neglect.

Houston County is a mid-size county located in the southeastern corner of Minnesota on the Iowa and Wisconsin borders. The county seat is Caledonia. It is considered part of the LaCrosse, Wisconsin, Metropolitan Statistical Area. In 1999, Houston County had a per capita personal income of \$25,103, which ranked twenty-fifth among Minnesota counties. Services, state and local government, and transportation and public utilities were the largest industries in 1999. Finance, insurance and real estate was the fastest growing industry, increasing almost 19% between 1998 and 1999. The county's 2000 unemployment rate was 4%.

Positives: Lower than average percentage of births to teens, children born at low birth weight, students changing schools and arrests for serious crime.

Concerns: None based on these indicators.

Trends to Watch: Decrease in percentage of children receiving food stamps and free or reduced price school lunch. Increase in children born at low birth weight.

Measuring the Well-Being of Children in Meeker County for the Decade

More Average Less
Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Meeker County is a mid-size county in central Minnesota. The county seat is Litchfield. The 1999 per capita personal income in Meeker County was \$22,558, ranking fifty-fourth among Minnesota counties. The largest industries in 1999 were durable goods manufacturing, state and local government, and services. Farming was the fastest growing industry in the county, with income more than doubling between 1998 and 1999. The county's 2000 unemployment rate was 6.4%.

Positives: Lower than average percentage of students changing schools and reports of child abuse and neglect.

Concerns: None based on these indicators.

Trends to Watch: Decreases in percentage of children receiving food stamps and free or reduced price school lunch.

Measuring the Well-Being of Children in Morrison County for the Decade

Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Morrison County is a moderately large county located in central Minnesota. The county seat is Little Falls. The county's 1999 per capita personal income was \$20,249, ranking eighth lowest among Minnesota counties. The largest industries in 1999 in the county were services, state and local government, and durable goods manufacturing. An increase in construction of 12% made it the fastest growing industry in Morrison County between 1998 and 1999. The county's 2000 unemployment rate was 6.5%.

Positives: Lower than average county for percentage of children born at low birth weight and percentage of students changing schools.

Concerns: None based on these indicators.

Trends to Watch: Increase in percentage of children born at low birth weight.

Measuring the Well-Being of Children in Pennington County for the Decade

More Average Less
Compared to the Avg. County 1991-2000
 (definitions for the data are on p. 121)

Pennington County is a moderately small county located in northwestern Minnesota. The county seat is Thief River Falls. The county's 1999 per capita personal income of \$24,800 was twenty-eighth among Minnesota counties. The largest industries in Pennington County in 1999 were services, durable goods manufacturing, and wholesale trade. Transportation and public utilities was the fastest growing industry in the county, increasing by 12% between 1998 and 1999. The county's 2000 unemployment rate was 6.9%.

Positives: Lower than average reports of child abuse and neglect.

Concerns: Higher than average percentage of students not graduating on time, and arrests for serious crime.

Trends to Watch: Increase in percentage of children not graduating on time.

Measuring the Well-Being of Children in Polk County for the Decade

Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Polk County is a moderately large county in northwest Minnesota on the North Dakota border and the Red River. The county seat is Crookston. During the summer months, the county's population includes migrant farm workers and their children. Its 1999 per capita personal income of \$23,376 ranked forty-first among Minnesota counties. The largest industries in the county in 1999 were services, state and local government, and retail trade. The fastest growing industry between 1998 and 1999 was non-durable goods manufacturing, which increased 17%. The county's 2000 unemployment rate was 4.8%.

Positives: Close to average county for many indicators of child well-being.

Concerns: Higher than average percentage of children receiving free or reduced-price lunch, school transfers, reports of abuse and neglect, and out-of-home placements.

Trends to Watch: Decrease in children receiving food stamps; increase in teen birth rate.

Measuring the Well-Being of Children in Rock County for the Decade

Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Rock County is the fifteenth smallest county and is located in the southwest corner of Minnesota, bordering South Dakota and Iowa. The county seat is Luverne. Rock County's per capita personal income of \$23,448 ranked thirty-seventh among Minnesota counties in 1999. The largest industries in the county in 1999 were state and local government, services, and farming. Non-durable goods manufacturing more than doubled between 1997 and 1998, making it the fastest growing industry. The county's 2000 unemployment rate was 2.9%.

Positives: Lower than average percentage of children receiving food stamps and arrests for serious crime.

Concerns: None based on these indicators.

Trends to Watch: Decrease in percentage of children receiving food stamps.

Measuring the Well-Being of Children in Todd County for the Decade

Compared to the Avg. County 1991-2000

(definitions for the data are on p. 121)

Todd County is a mid-size county located in the central portion of Minnesota. The county seat is Long Prairie. The county's 1999 per capita personal income of \$17,369 was the lowest among Minnesota counties. The largest industries in the county in 1999 were non-durable goods manufacturing, state and local government, and services. Non-durable goods manufacturing was the fastest growing industry in Todd County, increasing 8% between 1998 and 1999. The county's 2000 unemployment rate was 5.7%.

Positives: Close to average county for many indicators of child well-being.

Concerns: Higher than average percentage of children receiving free or reduced price lunch and children born at low birth weight.

Trends to Watch: Decrease in percentage of children receiving food stamps.

Measuring the Well-Being of Children in Traverse County for the Decade

Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Traverse County is located in the west central part of the state on the South Dakota border. The county seat is Wheaton. It is the second smallest county in Minnesota. The county's 1999 per capita personal income of \$22,987 ranked forty-eighth among Minnesota counties. The largest industries in the county in 1999 were state and local government, farming, and services. Between 1998 and 1999, the fastest growing industry in Traverse County was farming, which increased 25%. The county's 2000 unemployment rate was 5.9%.

Positives: Lower than average rate of births to teens, low birth weight babies, students not graduating on time, arrests for serious crimes, out-of-home placements, and violent deaths.

Concerns: Higher than average percentage of children in low-income families, and reports of child abuse and neglect.

Trends to Watch: Increase in reports of child abuse and neglect.

Measuring the Well-Being of Children in Yellow Medicine County for the Decade

More Average Less
Compared to the Avg. County 1991-2000
(definitions for the data are on p. 121)

Yellow Medicine County is a moderately small county located on the South Dakota border in the southwestern portion of Minnesota. The county seat is Granite Falls. The Upper Sioux Indian Reservation is located within its borders. Its 1999 per capita personal income of \$21,555 ranks sixty-eighth among Minnesota counties. The largest industries in 1999 were services, state and local government, and farming, and the fastest growing industry was wholesale trade, which increased 28% from 1998. The county's 2000 unemployment rate was 5.3%.

Positives: Lower than average percentage of low birth weight babies and rate of arrests for serious crime.

Concerns: None based on these indicators.

Trends to Watch: Increase in teen birth rate.

Family Economics

	1991	1996	2000	2000 State
Children in poverty (1989, 1995, 1998)	657	21%	390	12%±3
Children receiving food stamps (<130% poverty)	407	13%	234	8%
Children receiving free/reduced-price school lunches (91-92, 96-97, 00-01) (<185% poverty)	799	35%	823	37%

Starting Out

Children born to teenage mothers (a)/3-yr rate per 1,000 *	4	3	15	9	25	1,797	15.9
Children born at low birth weight	4	3%	4	3%	7	5%	4,140
Children changing schools (92-93, 95-96, 99-00)	212	9%	193	9%	189	9%	122,333

Challenges to Success

Children not graduating on time (1997, 2000)	13	10	11	8	5%	10	7%	14,064	21.5%

Demographics and County Descriptions

Estimated population, projected population:

Source: U.S. Census Bureau, <http://www.census.gov/> (estimated population), Minnesota Office of the State Demographer, <http://mnplan.state.mn.us/> (population projections.)

Per Capita Personal Income:

Source: Bureau of Economic Analysis, U.S. Department of Commerce. <http://www.bea.doc.gov/bea/regional/bearfacts/bf1/27/index.htm>

Definition: The personal income of an area is defined as the income received by, or on behalf of, all the residents of the area. It consists of the income received by persons from all sources. Per capita personal income is calculated as the personal income of the residents of an area divided by the population of the area.

Unemployment Rate

Source: Minnesota Department of Economic Security. <http://www.mnworkforcecenter.org/mi/laus/laus1.htm>

Definition: "Unemployed persons" includes all civilian, non-institutionalized persons aged 16 or older who, during the week of the 12th, were not employed, available for work, and engaged in job seeking activities during the last 4 weeks; waiting to be called back to a job from which they were laid off; or waiting to report (within 30 days) to a new wage or salaried job. "Unemployed persons" does not count persons who worked at least one hour during the week of the 12th and persons employed but not at work (i.e. on leave).

Major Industries and Growth

Source: Bear Facts, Bureau of Economic Analysis, US Department of Commerce. <http://www.bea.doc.gov/bea/regional/bearfacts/bf1/27/index.htm>

Definition: The largest industries are defined as those having the highest amount of earnings during that calendar year. The fastest growing industries are selected among those industries that accounted for at least 5% of total earnings.

Counties With Migrant Children and Families During the Summer Months

Definition: Counties that have services for migrant families located within their borders, such as migrant health clinics or legal clinics. Other counties may also have migrant farm workers populations.

Indicators

Children Living in Poverty

Source: US Bureau of the Census, Small Area Income and Poverty Estimates. <http://www.census.gov/hhes/www/saipe.html>

Definition: An estimate of the number of children below the federal poverty line (see guidelines on page 7.) The Census Bureau creates this estimate based on administrative data derived from tax returns, counts of food stamp participants, data
(continued on page 122)

Data Notes, continued from page 121

from the Bureau of Economic Analysis (BEA), decennial census estimates, intercensal population estimates, and the March Current Population Survey (CPS). A complete report on the methodology is available at <http://www.census.gov/hhes/www/sauipe/techdoc/strategy.html>.

Children Receiving Food Stamps

Source: Minnesota Department of Human Services, Reports and Forecasts Division.

Definition: The number of children receiving food stamps during July of each year. The percentage is the estimated number of children receiving food stamps (51%) divided by the estimated total number of children in the state or county. Numbers for Mille Lacs County do not include the Mille Lacs County Band of Ojibwe. Not all income-eligible children participate in the program.

Children Receiving for Free/Reduced Price School Lunches

Source: Minnesota Department of Children, Families and Learning. <http://cfl.state.mn.us/datactr/datactr2.htm>

Definition: The number of children approved to receive these meals in October of each school year. Family income must be below 185% of the Federal Poverty Level (see guidelines on page 7.) The percentage is the number of children approved divided by the total enrollment. Schools are assigned to the county where their district offices are located. Not all income-eligible children participate in the program, and private and home-schooled children are not included.

Children Born to Teenage Mothers

Source: Minnesota Department of Health, Center for Health Statistics. <http://www.mnplan.state.mn.us/datanetweb/health.html>

Definition: The number of children born to women who were less than age 18 at the time of birth. The rate of births is a three-year average of the number of births to 15 to 17-year-olds divided by the estimated population of females 15-17 years. This provides larger numbers and more accurate rates at the county level. Information is collected from birth certificates, and births are assigned to the county in which the mother resides, even if the birth occurs in a different county.

Children Born at Low Birth Weight

Source: Minnesota Department of Health, Center for Health Statistics. <http://www.mnplan.state.mn.us/datanetweb/health.html>

Definition: The number of infants weighing less than 2500 grams (5.5 pounds) at birth. The percentage is the number of these births divided by the total number of births. Information is collected from birth certificates, and births are assigned to the county in which the mother resides, even if the birth occurs in a different county.

Children Changing Schools

Source: Minnesota Department of Children, Families and Learning. <http://cfl.state.mn.us/datactr/datactr2.htm>

Definition: A count of student transfers into and out of schools in other districts and between schools within a district. Students who transfer more than once in a school year are counted each time they transfer. The percentage of transfers (or Mobility

Index) is calculated by adding together the mid-year enrollments, transfers and withdrawals and then dividing by the district's October 1 enrollment. Schools are assigned to the county where their district offices are located.

Children Not Graduating On Time

Source: Minnesota Department of Children, Families and Learning. <http://cfl.state.mn.us/datactr/compstu/compstu1.htm>

Definition: The number of students in grade 12 who have either dropped out during 9-12th grades or are continuing their education and thus are not graduating with their class. The percentage is the number of students not graduating on time divided by the total enrollment of their class. Only students who attended school in the same district all four years are measured in this indicator. Schools are assigned to the county where there district offices are located, and private and home-schooled children are not included. State totals will not match district totals due to methodology issues detailed in the full report.

Children Arrested for Serious Crime

Source: Minnesota Bureau of Criminal Apprehension. <http://www.dps.state.mn.us/bca/CJIS/Documents/>

Definition: The number of children under 18 arrested for Part I crimes: murder, rape, robbery, aggravated assault, burglary, larceny, vehicle theft and arson. The rate per 1,000 is the total number of children arrested for Part I crimes divided by the estimated number of children ages 10-17 multiplied by 1,000. Not all children arrested for serious crimes committed these crimes, and some children are not arrested for crimes that they actually committed. These rates are useful for comparison purposes and trends, but may be low because of the inclusion of children in the younger age ranges and the inclusion of girls, both of whom have few arrests.

Children Abused and Neglected

Source: Minnesota Department of Human Services. <http://www.dhs.state.mn.us/childint/Research/maltreat.htm>

Definition: The number of children for whom a report of child abuse or neglect was substantiated by a county child protection worker. The rate is the number of these children divided by the estimated total number of children and multiplied by 1,000. Substantiated abuse means that the county has conducted an assessment in response to a report and found that maltreatment occurred.

Children in Out-of-Home Placements

Source: Minnesota Department of Human Services. <http://www.dhs.state.mn.us/childint/Research/outofhome.htm>

Definition: The number of children who spent time in foster care, group homes, emergency shelter or residential treatment facilities during the year, including those formally placed with relatives. The rate is the number of these children divided by the estimated total number of children and multiplied by 1,000. This figure does not include most children in correctional facilities.

(continued on page 124)

Data Notes, continued from page 123

Children Dying from Homicide, Suicide and Injury

Source: Minnesota Department of Health, Center for Health Statistics. <http://www.mnplan.state.mn.us/datanetweb/health.html>
Definition: The number of children dying from homicide, suicide and unintentional injuries, including motor vehicle crashes (as drivers, passengers or bystanders), falls, and drowning. The region rates are given as three year averages; the county rate is the number of children dying for all years 1991-00, divided by the estimated total number of children, multiplied by 10,000. This provides larger numbers and more accurate rates at the county and region levels. The information is obtained from death certificates, which may not always be completed accurately, especially in cases of child abuse deaths or suicides.

About the Bar Graphs for Counties

The graphs allow comparison of multiple indicators within a county. At a glance, you are also able to see how a county compares to the state average for each indicator. The "County Average" is the mean of all counties' data points. Each thin line represents one standard deviation above or below the average.

Standard scores for each indicator (also known as z-scores) are computed by taking the difference between each data point and the mean, and dividing it by the standard deviation (a measure of the degree to which all of the counties' data points cluster around the mean.)
